

Impervious Soil Coverage Change Mapping 2005 to 2011

Impervious Soil Coverage [%]

1. Shown is the percentage difference between the degree of sealing between 2005 and 2011 based on the statistical blocks of ISU (2010/12/31).
2. The sealing levels were determined for both years based on the same mapping method using satellite data and are therefore comparable.
3. Changes of less than 10% are not shown. This is partly due to methodological changes (pseudo changes).

Scale: 1 : 50 000
