Traffic Sources (without Air Traffic)

Centerline Road Traffic

Centerline Railway Traffic

Centerline Tram and Overground Metro

1. This map is not a component of the directive of the European Parliament relating to the assessment and management of environmental noise. Maps represent the attempt to present a summary contemplation of the single traffic noise-sources.

Due to lacking knowledge about the dose-effect relationships, only an energy summation was proceeded. Therefore the contemplation of the total noise cannot meet the requirements to respect the burden-effects of the individual noise sources.

2. The "Directive of the European Parliament and of the Council relating to the assessment and management of environmental noise" came into force on 18th February 2002. This Directive aims at: - defining the basic concepts and methods for assessing environmental noise - determining the load caused by environmental noise by means of noise maps and according to assessment methods to be used by all of the Member States - adopting measures to reduce environmental noise, based on the results of noise maps and aiming at preventing and reducing environmental noise where necessary and particularly in cases where exposure levels might have effects that are detrimental to health.

3. The following noise sources were examined:
 - Road traffic (motor vehicles including buses)
 - Domestic traffic (pedestrians, bicycles, horse-drawn traffic)
 - Industrial and commercial areas with plants complying with Annex I of Directive 96/61/EC
 - Air traffic (according to the ICAO Convention)
 - Railway traffic according to the Allgemeines Eisenbahngesetz (AEG, General Railroad Law). Included in the examination were further relevant main noise sources in the Brandenburg area adjoining the borders, which exceed the specified immission levels (excluding Schönefeld Airport).
