

Strategic Noise Map Railway Traffic  
LN (noise index night)

L\_N in dB(A)

1. The "Directive of the European Parliament and of the Council relating to the assessment and management of environmental noise" came into force on 18th February 2002. This requires the following actions:

- determining the load caused by environmental noise by means of noise maps and according to assessment methods to be used by all of the Member States
- adoption of action plans through the Member States based on the results of noise maps and aiming at preventing and reducing environmental noise where necessary and particularly in cases where exposure levels might have effects that are detrimental to health.

2. The following noise sources were examined:

- Road traffic (motor vehicles including buses)
- Streetcar traffic and above-ground subway traffic
- Industrial and commercial areas with plants complying with Annex I of Directive 96/61/EC
- Air traffic (Tegel Airport)
- Railway traffic according to the Allgemeines Eisenbahngesetz (AEG, General Railroad Law).

Included in the examination were further relevant main noise sources in the Brandenburg area adjoining the borders, which exceed the specified immission levels (excluding Schönefeld Airport).

3. Noise maps must always be calculated. Calculations must comply with the preliminary EU-conforming calculation rules, which deviate from the Technical Codes that are binding according to national law in some aspects. Noise maps are to be reviewed and, if necessary, revised every five years after they have been drawn up.

4. As required in the "Directive on the Assessment and Management of Environmental Noise", strategic noise maps graphically represent the noise situation in the following isophone classes:

Representation of isophone classes according to the requirements of 34th BImSchV	
LDEN > 55 dB(A) up to 60 dB(A)	LNight > 50 dB(A) up to 55 dB(A)
LDEN > 60 dB(A) up to 65 dB(A)	LNight > 55 dB(A) up to 60 dB(A)
LDEN > 65 dB(A) up to 70 dB(A)	LNight > 60 dB(A) up to 65 dB(A)
LDEN > 70 dB(A) up to 75 dB(A)	LNight > 65 dB(A) up to 70 dB(A)
LDEN > 75 dB(A)	LNight > 70 dB(A)

5. The noise exposure is specified through the following variables:

- Tabular data about the estimated number of persons living in areas located within the isophone maps. Figures should be rounded up or down to the next hundred place.
- Tabular data about noise-exposed areas as well as the estimated number of dwellings, schools and hospitals in these areas for the following LDEN values: LDEN > 55 dB(A), LDEN > 65 dB(A), LDEN > 75 dB(A).

Scale: 1 : 50 000
